transporters of the SLC-families preferably transport hydrophilic and amphiphilic xenobiotics. These carriers could confer some organ selectivity in xenobiotic elimination and toxicity. E.g. the Green Death Cap mushroom toxin phalloidin has long been recognised to be a liver-selective toxin. Drug transporters in

Transporter-mediated drug-drug interactions in the kidney dramatically influence the pharmacokinetics and other clinical effects of drugs. Human organic anion transporters 1 (hOAT1) and 3 (hOAT3) are the major transporters in the basolateral membrane of kidney proximal tubules, mediating the rate-limiting step in the elimination of a broad spectrum of drugs. During the past decade, significant advances in molecular identification and characterization of transporter proteins have been made. Although it is generally noted that these transporters significantly contribute to renal drug handling and variability in drug disposition, the extent of our Transporters and renal drug elimination. The use of metabolite, lipid, and protein profiles for systems biology, biomedical research, and clinical applications has risen dramatically over recent years. Global profiling allows for the detection, identification and relative quantification of candidate biomarkers, or more specifically molecular markers, which discriminate disease processes, oxidative stress, injury, histopathological ...
